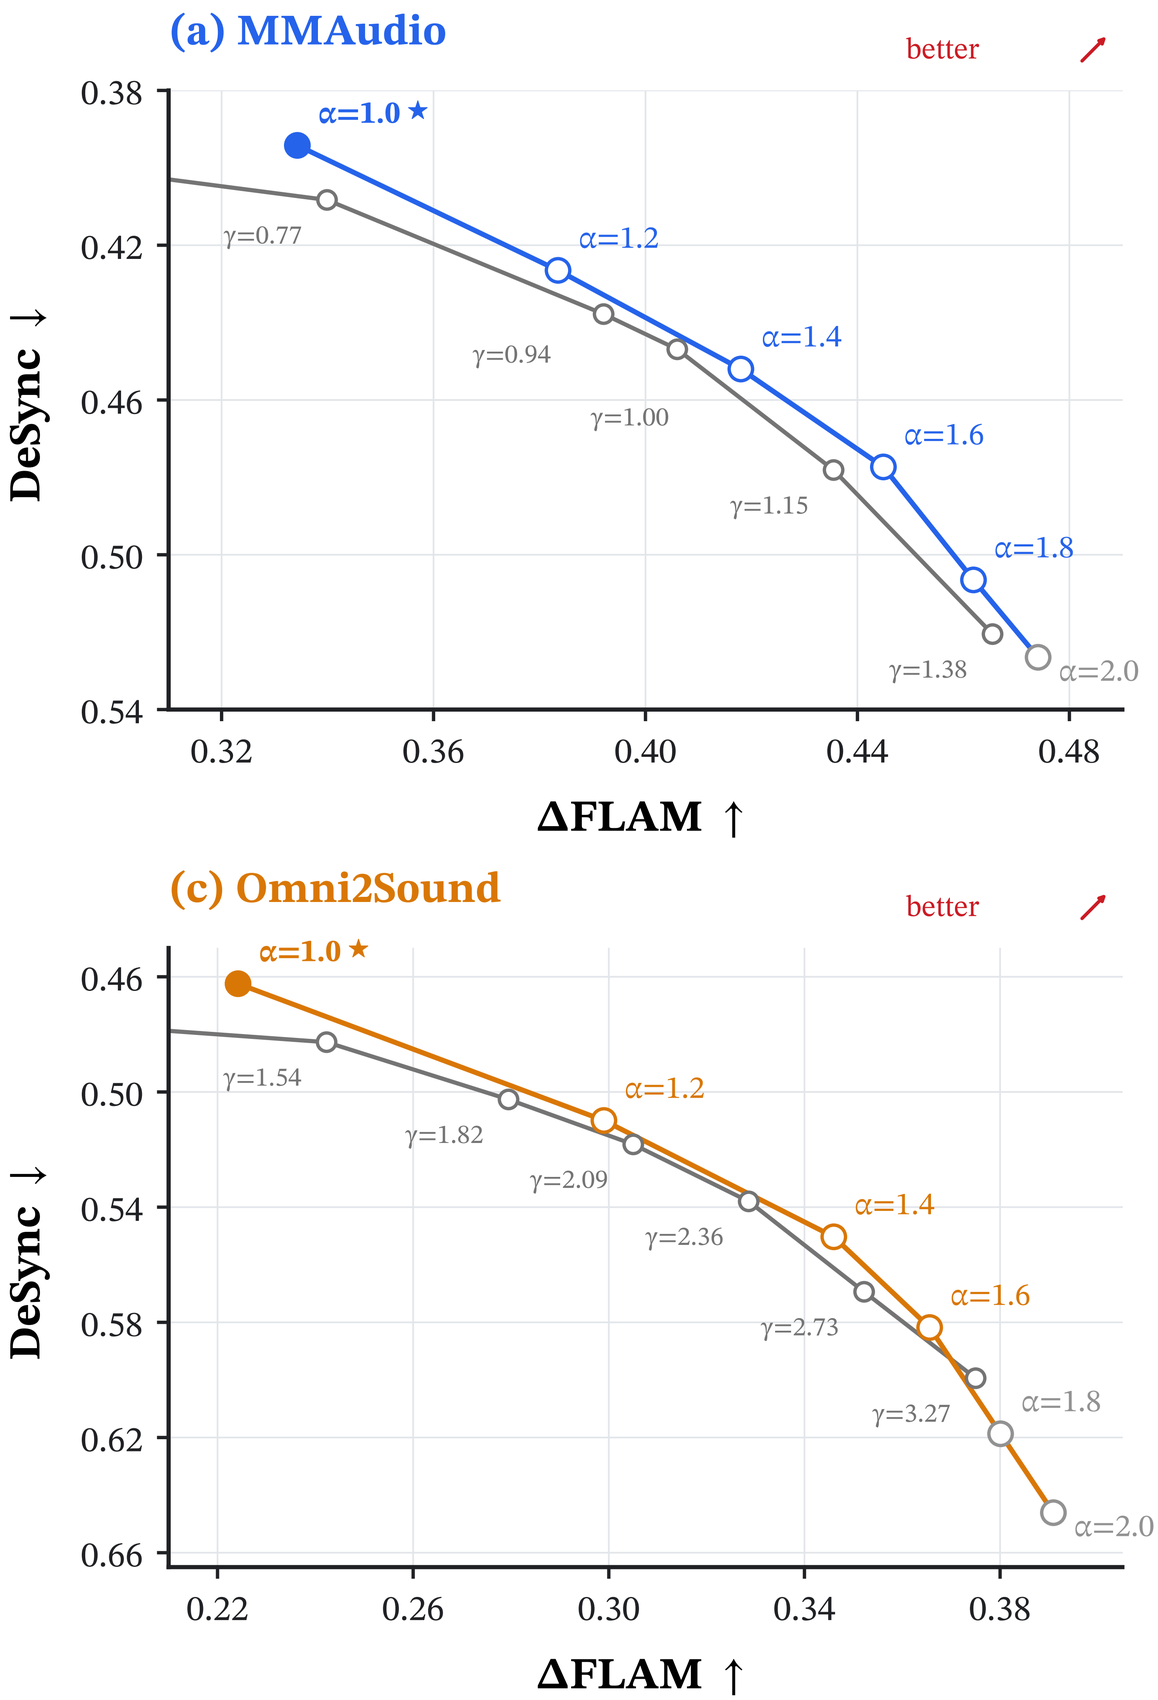
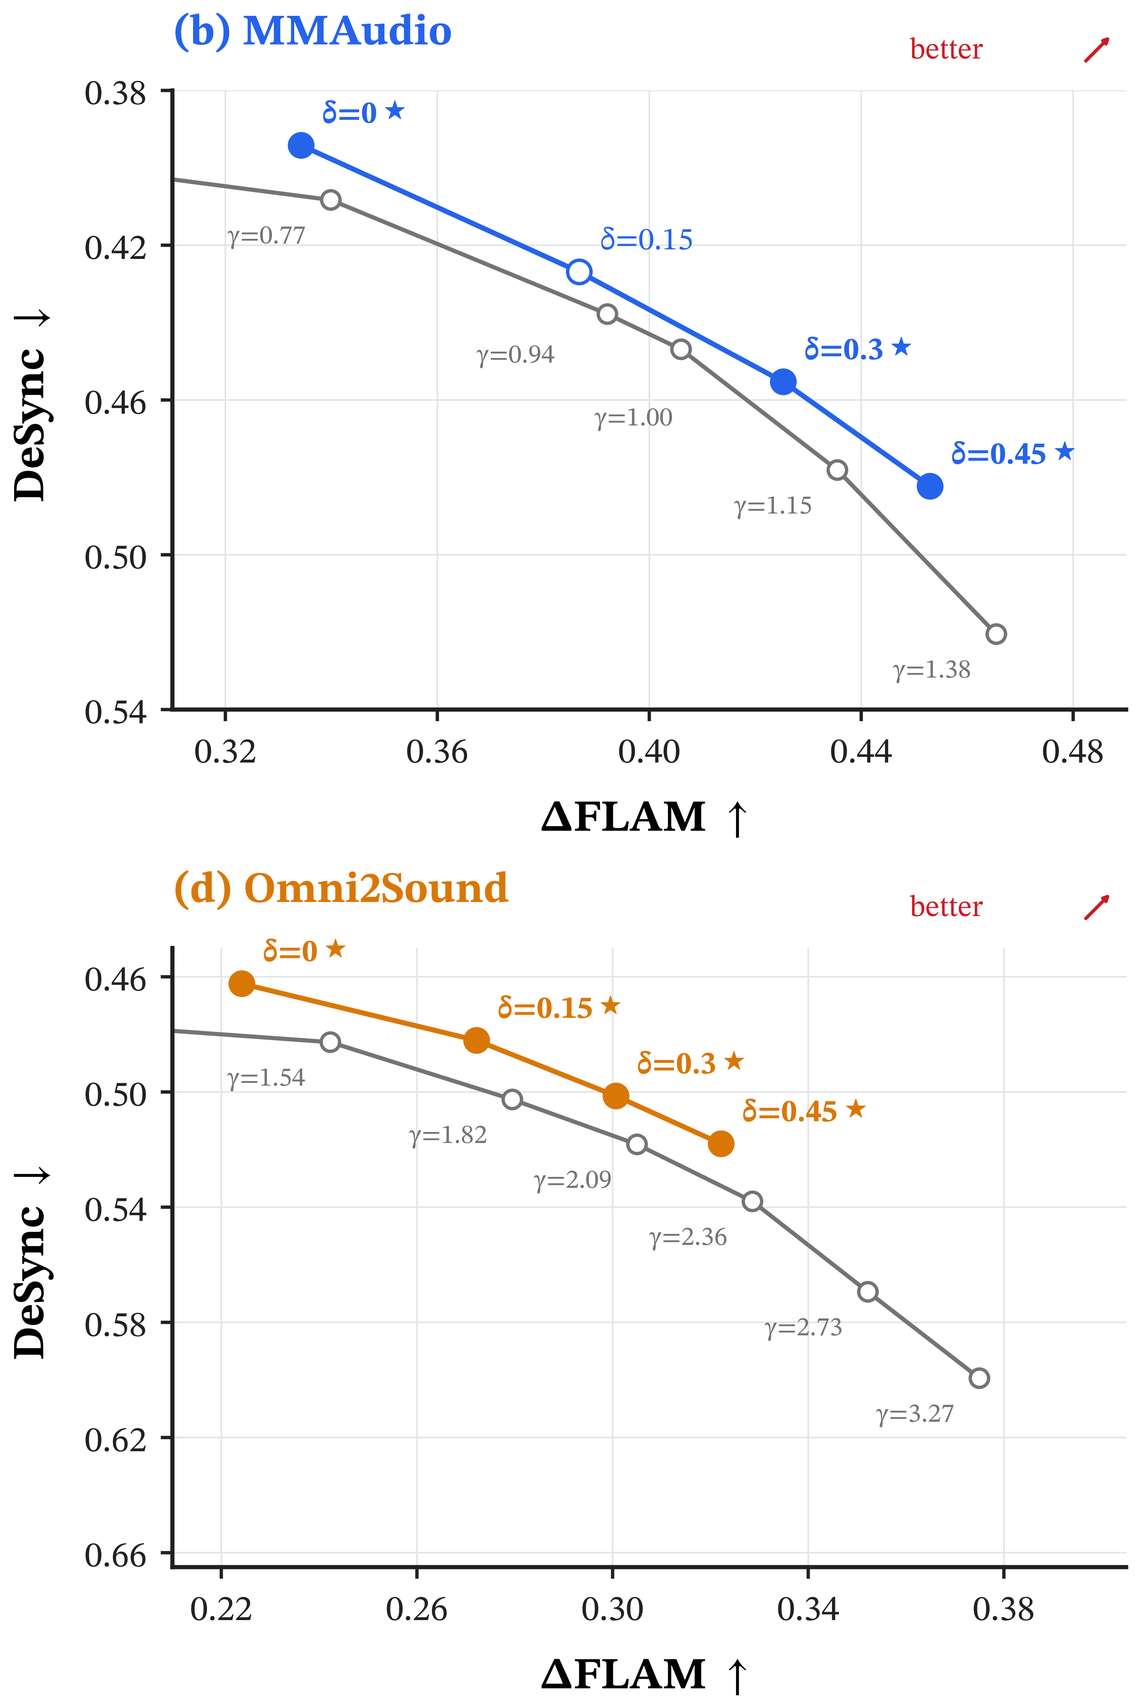
α sweep (submitted rule)

vs. constant γ



Margin δ sweep (refined rule)

vs. constant γ



★ significantly better than the constant-weight curve at matched ΔFLAM and at matched DeSync (cluster bootstrap, Holm over each sweep, $p < 0.05$); hollow: n.s.; gray: outside the constant-weight range.

Gray: constant γ (same for all samples and steps). Colored: TAP-Foley. Default CFG ($\gamma = 0$) is outside view. Same axes within each row.
